

ABSTRACT OF THE DISCLOSURE

5 A universal eyeglass attachment includes a docking head which is
removably attachable to a frame of primary eyeglasses. A clip or coupling is
attached to auxiliary eyewear and configured for connection to the docking head
so as to removably attach the auxiliary eyewear to the primary eyeglasses. The
clip or coupling is preferably pivotally attached to the auxiliary eyewear to
enable a user to selectively move the eyewear away from lenses of the primary
eyeglasses. Swing-arm locks can be incorporated to strengthen the frictional
10 engagement fit between the auxiliary eyewear and eyeglass frame.
